

IN THE ABSTRACT

Please substitute the following Abstract for the Abstract contained in the application.

---Abstract of the Disclosure

A remote control system in which an instruction from a remote terminal is transmitted to a controlled device through a remote control device. Device unique data which is information specific to the controlled device is stored in the remote control device or the controlled device. The remote control device generates WEB display data to be displayed on the remote terminal based on a device type of the controlled device and the device unique data. Alternatively, the remote control device generates WEB display data based on the device unique data stored in the controlled device. Thus, even when a new type of controlled device is developed, or even when the function for the controlled device is extended, it does not need to modify programs for achieving functions of the remote control device. Accordingly, it facilitates a change of an operational screen of the terminal in response to those changes.---
